**A-Z**

1. First create the html elements according to the BEM model. with a list of items, and two buttons, for discount and checkout all wrapped in one container. Add an onclick event to each button.

2. Style the webpage in CSS so the images for each item is displayed orderly and correctly. preferably with a grid layout.

3. Create a function to add items to cart, triggered by the onclick event attached to the product items. Then add a checkout function, then a discount function, and lastly add a function to display the time/date

4. If the product looks finished then publish if not then revamp the design and add additional features

Come up with and sketch the idea

The goal is to make a Shop where you can add on as many items you would like without having to alter the code that much.

I would also like to have a discount button that adds 20% discount, and a checkout button

Plan the design and functionality

Create HTML

Style in CSS

Add functionality in JS

Add additional features

Not finished?

Finished?

Export the final product
